Introduction

The main aim of this booklet is to exemplify standards for those teaching Cambridge International AS & A Level Computer Science (9608), and to show how different levels of candidates’ performance relate to the subject’s curriculum and assessment objectives.

In this booklet candidate responses have been chosen to exemplify a range of answers. Each response is accompanied by a brief commentary explaining the strengths and weaknesses of the answers.

For ease of reference the following format for each component has been adopted:

Question

Mark scheme

Example candidate response

Examiner comment

Each question is followed by an extract of the mark scheme used by examiners. This, in turn, is followed by examples of marked candidate responses, each with an examiner comment on performance. Comments are given to indicate where and why marks were awarded, and how additional marks could have been obtained. In this way, it is possible to understand what candidates have done to gain their marks and what they still have to do to improve their marks.

This document illustrates the standard of candidate work for those parts of the assessment which help teachers assess what is required to achieve marks beyond what should be clear from the mark scheme. Some question types where the answer is clear from the mark scheme, such as short answers and multiple choice, have therefore been omitted.

Past papers, Examiner Reports and other teacher support materials are available on Teacher Support at https://teachers.cie.org.uk
### Assessment at a glance

For Cambridge International AS and A Level Computer Science, candidates may choose:

- to take Papers 1, 2, 3 and 4 in the same examination series, leading to the full Cambridge International A Level
- to follow a staged assessment route by taking Papers 1 and 2 (for the AS Level qualification) in one series, then Papers 3 and 4 (for the full Cambridge International A Level) in a later series
- to take Papers 1 and 2 only (for the AS Level qualification).

Advanced Subsidiary (AS) forms 50% of the assessment weighting of the full Advanced (A) Level.

Teachers are reminded that the latest syllabus is available on our public website at [www.cie.org.uk](http://www.cie.org.uk) and Teacher Support at [https://teachers.cie.org.uk](https://teachers.cie.org.uk)
Paper 2 – Fundamental Problem-solving and Programming Skills

Question 1

Throughout the paper you will be asked to write either pseudocode or program code.

Complete the statement to indicate which high-level programming language you will use.

Programming language

1 A marathon runner records their time for a race in hours, minutes and seconds.

An algorithm is shown below in structured English.

   INPUT race time as hours, minutes and seconds
   CALCULATE race time in seconds
   STORE race time in seconds
   OUTPUT race time in seconds

(a) The identifier table needs to show the variables required to write a program for this algorithm.

   Complete the table.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RaceHours</td>
<td>INTEGER</td>
<td>The hours part of the race time.</td>
</tr>
</tbody>
</table>

   [3]

(b) Before the program is written, the design is amended.

   The new design includes input of the runner's current personal best marathon time (in seconds).

   The output will now also show one of the following messages:

   - “Personal best time is unchanged”
   - “New personal best time”
   - “Equals personal best time”

   (i) Show the additional variable needed for the new design.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
</table>

   [1]
Question 1, continued

(ii) Write program code for the new design.

Visual Basic and Pascal: You should include the declaration statements for variables.

Python: You should show a comment statement for each variable used with its data type.

Programming language

<tbody>
<tr>
<td>PersonalBestTime</td>
<td>INTEGER/REAL</td>
<td>Personal best time in seconds</td>
</tr>
</tbody>
</table>

meaningful name + data type [1]

(ii) Mark as follows:

- Declarations/comments for variables – at least 2
- Input (+ prompts) for hours, minutes, seconds
- Input (+ prompt) of personal best time
- Correct calculation of RaceTimeIn Seconds (don’t allow use of ‘x’ for ‘**’)
- Output RaceTimeIn Seconds
- Correct logic and output message for < personal best
- Correct logic and output message for > personal best
- Correct logic and output message for = personal best [max 7]

(c) (i) • Choosing data/values...
- Test every possible ‘logic path’ through the code
  // with knowledge of the structure/code

  Ignore any reference to normal/boundary/external ...

  [2]

(ii)   • PersonalBest column labelled
- Test number 1 message: “Equals personal best time”/or similar
- Test 2/Test 3 – data for better performance ...
- Described with suitable message
- Test 2/Test 3 – data for worse performance ...
- Described with suitable message [6]
Example candidate response – high

Throughout the paper you will be asked to write either pseudocode or program code.

Complete the statement to indicate which high-level programming language you will use.

Programming language

1 A marathon runner records their time for a race in hours, minutes and seconds.

An algorithm is shown below in structured English.

INPUT race time as hours, minutes and seconds
CALCULATE race time in seconds
STORE race time in seconds
OUTPUT race time in seconds

(a) The identifier table needs to show the variables required to write a program for this algorithm.

Complete the table.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RaceHours</td>
<td>INTEGER</td>
<td>The hours part of the race time.</td>
</tr>
<tr>
<td>Race Minutes</td>
<td>Integer</td>
<td>The minutes part of the time.</td>
</tr>
<tr>
<td>Race Seconds</td>
<td>Integer</td>
<td>The seconds part of the race time.</td>
</tr>
<tr>
<td>Total Time</td>
<td>Integer</td>
<td>Total time in seconds</td>
</tr>
</tbody>
</table>

(b) Before the program is written, the design is amended.

The new design includes input of the runner’s current personal best marathon time (in seconds).

The output will now also show one of the following messages:

- "Personal best time is unchanged"
- "New personal best time"
- "Equals personal best time"

(i) Show the additional variable needed for the new design.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current Best</td>
<td>Integer</td>
<td>total seconds for PB</td>
</tr>
</tbody>
</table>
Example candidate response – high, continued

(ii) Write program code for the new design.

*Visual Basic and Pascal: You should include the declaration statements for variables.*

*Python: You should show a comment statement for each variable used with its data type.*

```
Programming Language: Visual Basic

Module Main

    Dim RaceMinutes As Integer
    Dim RaceSeconds As Integer
    Dim TotalTime As Integer
    Dim CurrentBest As Integer

    Console.Write("Input Runner's hour(s):")
    RaceHours = Console.ReadLine()

    Console.Write("Input Runner's minute(s):")
    RaceMinutes = Console.ReadLine()

    Console.Write("Input Runner's second(s):")
    RaceSeconds = Console.ReadLine()

    TotalTime = (RaceHours * 3600) + (RaceMinutes * 60) + RaceSeconds

    Console.Write("Input Current personal best:";
    CurrentBest = Console.ReadLine()

    Console.Write("Your total time is:";
    Console.Write(TotalTime)

    If CurrentBest > TotalTime Then
        Console.Write("New personal best time."
    Else If CurrentBest = TotalTime Then
        Console.Write("Equalled personal best time.");
    Else If CurrentBest < TotalTime Then
        Console.Write("Personal best time is unbeatable.");
    End If

End If
```
Example candidate response – high, continued

(c) The program code will be tested using white-box testing.

(i) Explain what is meant by white-box testing.

Examiner comment – high

In parts (a) and (b)(i) the candidate has correctly identified from the given algorithm the variables needed.

In part (b)(ii) candidates must write the name of the programming language which is to be used; that is, either Visual Basic.NET, Python or Pascal. The candidate here has written that the code will be contained in the procedure sub_Main. This information is for the benefit of the marker. The candidate has followed the instructions given and started the coding with the declaration of the variables to be used. The code follows exactly the order of statements in the given algorithm. The input of the three numbers, the calculation of the total time in seconds and the final input of the personal best are all correctly coded. However, the logic for the final stage of the program is incorrect. The candidate should realise that if the new time is greater than the current personal best then the personal best will remain unchanged. However, the candidate’s logic for an equal time is correct and so scores one of the available three marks.

This is a clear answer for part (c)(i). The two key points looked for in the answer are firstly – that the programmer will need to have a detailed knowledge of the program code. Secondly – the programmer will need to carefully choose data values designed to test the various paths through the code. This clear thinking is put into practice for the final part (ii). The candidate has selected one time which is greater that the current personal best and one which is less. The numeric time values are complemented which a clear descriptive message.

Marks awarded for part (a) = 3/3
Marks awarded for part (b) = (i) 1/1, (ii) 5/7
Marks awarded for part (c) = (i) 2/2, (ii) 6/6

Total marks awarded = 17 out of 19
Example candidate response – middle

Throughout the paper you will be asked to write either pseudocode or program code.

<td>11053</td>
<td>Personal Best Time unchanged</td>
</tr>
</tbody>
</table>

Examiner comment – middle

In parts (a) and (b)(i) the candidate has followed the given algorithm and used appropriate identifier names.

The program code in part (b)(ii) has gained the maximum seven marks. The candidate has done as instructed and stated the language used before the first line of code. The candidate has used brackets, which are not required for the calculation of the TotalTimeSeconds variable, but the mark is still awarded for this statement. The logic for the final IF statement is correct.

In part (c)(i) the candidate is suggesting that white-box testing is the same as a dry-run trace away from the computer. Candidates should appreciate that knowledge of the code is required and test data must be carefully selected. This selection of data is then required in practice for the final part (c)(ii). The candidate has incorrectly repeated the same values.

Marks awarded for part (a) = 3/3
Marks awarded for part (b) = (i) 1/1, (ii) 7/7
Marks awarded for part (c) = (i) 0/2, (ii) 2/6

Total marks awarded = 13 out of 17
Example candidate response – low

Throughout the paper you will be asked to write either pseudocode or program code.

Complete the statement to indicate which high-level programming language you will use.

Programming language Visual basic

1 A marathon runner records their time for a race in hours, minutes and seconds.

An algorithm is shown below in structured English.

```
INPUT race time as hours, minutes and seconds
CALCULATE race time in seconds
STORE race time in seconds
OUTPUT race time in seconds
```

(a) The identifier table needs to show the variables required to write a program for this algorithm.

Complete the table.

<table>
<thead>

<td>11053</td>
<td>Personal best time</td>
</tr>
<tr>
<td>3</td>
<td>2</td>
<td>10</td>
<td>0</td>
<td>11053</td>
<td>7800</td>
<td>New personal best time</td>
</tr>
</tbody>
</table>

Examiner comment – low

The candidate seems to have confused the current total time with the personal best time. The choice of the third variable for part (a)(i) should match closely to the algorithm given in the question rubric.

For the program code in part (b)(ii) although the candidate has stated this is ‘Visual Basic’, it is clearly code that would have been written in the Visual Basic forms-based environment. The syllabus guideline states that if the chosen language is Visual Basic, this must use console mode. Also the variables used for the code do not match with those asked for in the identifier tables for the earlier parts (a) and (b)(i). Candidates should be encouraged the see the question as a whole and look for a progression which was the intention here.

The examiner has given the candidate the benefit of any doubt and assumed that the candidates’ intention is for RT to store the ‘current race time’ and RB to store the ‘race best time’ i.e. the personal best time. The final statements demonstrate the correct logic and so gain credit.

In part (c)(i) the explanation for white-box testing gains one of the available two marks. The concept of the need for test data is present.

For the final test data table in part (c)(ii), the candidate correctly shows a set of data values which give a new personal best time with a suitable commentary. However, the other data set is for another time which equals the current personal best and this test case is already given in the table.

Marks awarded for part (a) = 2/3
Marks awarded for part (b) = (i) 1/1, (ii) 4/7
Marks awarded for part (c) = (i) 1/2, (ii) 3/6

Total marks awarded = 11 out of 17
Question 2

2 A program displays a menu with choices 1 to 4. The code to display the menu is written as the procedure DisplayMenu.

(a) Pseudocode which uses this procedure is:

```
CALL DisplayMenu
REPEAT
    OUTPUT "Enter choice (1..4)"
    INPUT Choice
    UNTIL Choice >= 1 AND Choice <= 4
```

(i) Describe what this pseudocode will do.

...........................................................................................................................................[3]

(ii) State why a loop is required.

...........................................................................................................................................[1]

(b) The following pseudocode is a revised design.

```
CONSTANT i ← 3
CALL DisplayMenu
NoOfAttempts ← 0
REPEAT
    OUTPUT "Enter choice (1..4)"
    INPUT Choice
    NoOfAttempts ← NoOfAttempts + 1
    UNTIL (Choice >= 1 AND Choice <= 4) OR NoOfAttempts = i
```

(i) Give the maximum number of inputs the user could be prompted to make.

..............................................[1]

(ii) State why this algorithm is an improvement on the one given in part (a).

...........................................................................................................................................[1]
(c) The pseudocode is in its initial stage of development.

The table below shows the action currently taken by the pseudocode following each menu choice.

<table>
<thead>
<tr>
<th>Menu choice</th>
<th>Description</th>
<th>Program response</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Read data from the customer file</td>
<td>Calls a procedure ReadFile which for testing purposes outputs the message &quot;Read file code&quot;</td>
</tr>
<tr>
<td>2</td>
<td>Add a customer</td>
<td>Outputs message “Add customer code”</td>
</tr>
<tr>
<td>3</td>
<td>Search for a customer</td>
<td>Outputs message “Search customer code”</td>
</tr>
<tr>
<td>4</td>
<td>Terminates the program</td>
<td>Ends</td>
</tr>
</tbody>
</table>

Complete the pseudocode for the design in part (b), shown again below, to respond to each menu choice.

CONSTANT i ← 3
CALL DisplayMenu
NoOfAttempts ← 0
REPEAT
    OUTPUT "Enter choice (1..4)"
    INPUT Choice
    NoOfAttempts ← NoOfAttempts + 1
UNTIL (Choice >= 1 AND Choice <= 4) OR NoOfAttempts = i
(d) The algorithm in part (c) is to be amended. The program will:

- repeatedly display the menu and respond to the user’s choice
- terminate when the user enters 4

Write program code for this final design which will be made up of:

- the main program
- procedure ReadFile
- procedure DisplayMenu

Visual Basic and Pascal: You should include the declaration statements for variables.
Python: You should show a comment statement for each variable used with its data type.
Mark scheme

2  (a)  (i) Displays the menu (choices)
Repeats the prompt and input ...
...the input is a number between 1 and 4 // Checks number is between 1 and 4
"within range" is not enough [3]

(ii) ...the input number is validated [1]

(b)  (i)  3 [1]

(ii) Previous design repeated indefinitely // (new design) limits number of attempts
Penalise "Program terminates/closes" [1]

(c) IF Choice = 1 THEN (CALL) ReadFile
IF Choice = 2 THEN OUTPUT "Add Customer code" [1]
IF Choice = 3 THEN OUTPUT "Search Customer code" [1]
IF Choice = 4 THEN END [1]

alternative answer:

mark as follows:
CASE OF Choice // Select CASE Choice 1 mark
1: (CALL) ReadFile 1 mark (allow CASE = 1)
2: OUTPUT "Add Customer code" 1 mark
3: OUTPUT "Search Customer code" 1 mark
4: END
ENDCASE

Output strings must match [max 3]
Mark scheme, continued

(d) Mark as follows:

- **Choice / NoOfAttempts declared/commented as integer**
  Must appear within the 'main' program
  Allow: different identifier names

- **Constant i assigned a value 3**

- There is an 'outer' loop to **repeatedly display the menu**

- Input 'choice' variable

- Three **IF statements (or equivalent) for processing menu choices 1, 2 and 3**
  Note: they must be correctly formed as 'nested' or 'independent'

- **Choice 1 calls procedure ReadFile**

- **Choice 2 outputs “Add Customer Code”**
  + Choice 3 outputs “Search Customer Code”

- Outer loop terminates correctly with 'Choice = 4' //or equivalent

- **Procedure DisplayMenu shows the four menu options**

- **Procedure ReadFile is present ...**
  and contains a single output message ‘Read file code’  [max 8]
2. A program displays a menu with choices 1 to 4. The code to display the menu is written as the procedure DisplayMenu.

(a) Pseudocode which uses this procedure is:

```
CALL DisplayMenu
REPEAT
   OUTPUT "Enter choice (1..4)"
   INPUT Choice
   UNTIL Choice >= 1 AND Choice <= 4
```

(i) Describe what this pseudocode will do.

- It will first call the procedure DisplayMenu. It will then ask
  the user for a value. It will keep on asking until the user enters
  a valid option: 1, 2, 3, or 4.

(ii) State why a loop is required.

- To make sure that if the user enters an invalid option, the
  error is caught and the user is asked again.

(b) The following pseudocode is a revised design.

```
CONSTANT i ← 3
CALL DisplayMenu
NoOfAttempts ← 0
REPEAT
   OUTPUT "Enter choice (1..4)"
   INPUT Choice
   NoOfAttempts ← NoOfAttempts + 1
   UNTIL (Choice >= 1 AND Choice <= 4) OR NoOfAttempts = i
```

(i) Give the maximum number of inputs the user could be prompted to make.

- 3

(ii) State why this algorithm is an improvement on the one given in part (a).

- This method is child safe. Accidental errors will only happen once or
  twice, therefore, no need to ask indefinitely.

------------------------------------------------------------------------
Example candidate response – high, continued

(c) The pseudocode is in its initial stage of development.

The table below shows the action currently taken by the pseudocode following each menu choice.

<table>
<thead>
<tr>
<th>Menu choice</th>
<th>Description</th>
<th>Program response</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Read data from the customer file</td>
<td>Calls a procedure ReadFile which for testing purposes outputs the message &quot;Read file code&quot;</td>
</tr>
<tr>
<td>2</td>
<td>Add a customer</td>
<td>Outputs message &quot;Add customer code&quot;</td>
</tr>
<tr>
<td>3</td>
<td>Search for a customer</td>
<td>Outputs message &quot;Search customer code&quot;</td>
</tr>
<tr>
<td>4</td>
<td>Terminates the program</td>
<td>Ends</td>
</tr>
</tbody>
</table>

Complete the pseudocode for the design in part (b), shown again below, to respond to each menu choice.

```
CONSTANT i ← 3
CALL DisplayMenu
NoOfAttempts ← 0
REPEAT
   OUTPUT "Enter choice (1..4)"
   INPUT Choice
   NoOfAttempts ← NoOfAttempts + 1
UNTIL (Choice ≥ 1 AND Choice ≤ 4) OR NoOfAttempts = i

CASE Choice
   1: OUTPUT "Read file code" CALL ReadFile
   2: OUTPUT "Add customer code"
   3: OUTPUT "Search customer code"
   4: END
ENDCASE

PROCEDURE ReadFile: E OUTPUT "Read file code" 3
```

[3]
Example candidate response – high, continued

(d) The algorithm in part (c) is to be amended. The program will:

- repeatedly display the menu and respond to the user’s choice
- terminate when the user enters 4

Write **program code** for this final design which will be made up of:

- the main program
- procedure readFile
- procedure displayMenu

*Visual Basic and Pascal: You should include the declaration statements for variables.*
*Python: You should show a comment statement for each variable used with its data type.*

**Programming language: Python**

```
def DisplayMenu():
    print "1...Read data from customer file"
    print "2...Add a customer"
    print "3...Search for a customer"
    print "4...End"

def readFile():
    print "Read file and..."

While True:
    DisplayMenu()
    print "Enter choice (1-4):"
    choice = int(input(" ")) # Choice is an INTEGER

    if choice == 1:
        readFile()
    elif choice == 2:
        print "Add customer..."
    elif choice == 3:
        print "Search customer..."
    elif choice == 4:
        END
```

[8]
Examiner comment – high

In part (a)(i) the intention here was a description of what the code would appear to do for the user. Hence the first mark point is for describing that the list of menu choice will be displayed to the user. This is very different from an answer which simply repeats the pseudocode “it calls DisplayMenu”. Other key mark points are that the user sees a prompt and the program waits for an input from the user. The program will again prompt the user until the value entered is 1, 2, 3 or 4.

In part (a)(ii) the intention in the design is that the loop is there to perform validation of the user input. Many candidates – including this answer – used the words ‘invalid’ or ‘valid’ with a suitable explanation and gained credit.

Part (b)(i) required a simple trace of the algorithm to establish the three iterations. The answer here for part (b)(ii) is clear realising that the improvement is the user will only be prompted a limited number of times. Most candidates answered part (c) with a sequence of IF statements. This candidate has used the alternative CASE structure with the correct composition.

In part (d) this is almost exemplary Python program code. The candidate has stated that the language used is Python and used appropriate indentation. The syntax of the statements is all correct except for the candidate’s use of the comment statement. Candidates need to be clear that for this question it is program code that is required and so should use the appropriate comment symbol. The candidate has here incorrectly used syntax for comments in pseudocode.

Marks awarded for part (a) = (i) 2/3, (ii) 1/1
Marks awarded for part (b) = (i) 1/1, (ii) 1/1
Marks awarded for part (c) = 3/3
Marks awarded for part (d) = 7/8

Total marks awarded = 15 out of 17
2 A program displays a menu with choices 1 to 4. The code to display the menu is written as the procedure DisplayMenu.

(a) Pseudocode which uses this procedure is:

```
CALL DisplayMenu
REPEAT
    OUTPUT "Enter choice (1..4)"
    INPUT Choice
    UNTIL Choice >= 1 AND Choice <= 4
```

(i) Describe what this pseudocode will do.

```
The pseudocode will keep asking for input until a valid choice is entered. If an invalid choice such as 5 is chosen, it will ask for an input again.
```

(ii) State why a loop is required.

```
So that if an invalid choice is chosen, it can ask for an input again...
```

(b) The following pseudocode is a revised design.

```
CONSTANT i ← 3
CALL DisplayMenu
NoOfAttempts ← 0
REPEAT
    OUTPUT "Enter choice (1..4)"
    INPUT Choice
    NoOfAttempts ← NoOfAttempts + 1
    UNTIL (Choice >= 1 AND Choice <= 4) OR NoOfAttempts = i
```

(i) Give the maximum number of inputs the user could be prompted to make.

```
...........................
```

(ii) State why this algorithm is an improvement on the one given in part (a).

```
..........................................................................................................................
...........................................................................................................................[1]
```
(c) The pseudocode is in its initial stage of development.

The table below shows the action currently taken by the pseudocode following each menu choice.

<table>
<thead>
<tr>
<th>Menu choice</th>
<th>Description</th>
<th>Program response</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Read data from the customer file</td>
<td>Calls a procedure <code>ReadFile</code> which for testing purposes outputs the message &quot;Read file code&quot;</td>
</tr>
<tr>
<td>2</td>
<td>Add a customer</td>
<td>Outputs message &quot;Add customer code&quot;</td>
</tr>
<tr>
<td>3</td>
<td>Search for a customer</td>
<td>Outputs message &quot;Search customer code&quot;</td>
</tr>
<tr>
<td>4</td>
<td>Terminates the program</td>
<td>Ends</td>
</tr>
</tbody>
</table>

Complete the pseudocode for the design in part (b), shown again below, to respond to each menu choice.

```pseudocode
CONSTANT i ← 3
CALL DisplayMenu
NoOfAttempts ← 0
REPEAT
    OUTPUT "Enter choice (1..4)"
    INPUT Choice
    NoOfAttempts ← NoOfAttempts + 1
    UNTIL (Choice >= 1 AND Choice <= 4) OR NoOfAttempts = i

    CASE Choice = 1 THEN Select Case choice
    CASE 1 = Call ReadFile
    CASE 2 = Console.WriteLine("Add customer code")
    CASE 3 = Console.WriteLine("Search customer code")
    CASE 4 = End
```

[3]
(d) The algorithm in part (c) is to be amended. The program will:

- repeatedly display the menu and respond to the user's choice
- terminate when the user enters 4

Write program code for this final design which will be made up of:

- the main program
- procedure ReadFile
- procedure DisplayMenu

**Visual Basic and Pascal:** You should include the declaration statements for variables.

**Python:** You should show a comment statement for each variable used with its data type.

```plaintext
Programming language

Dim Choice as Integer
Dim customerCode as Integer
Call DisplayMenu
Repeat
    Console.WriteLine("Please make a choice")
    Choice = Console.ReadLine()
    If Choice = 1 Then
        Call ReadFile
        Console.WriteLine("Reading file code")
        Else If Choice = 2 Then
            Console.WriteLine("Add customer code")
            customerCode = Console.ReadLine()
            Else If Choice = 3 Then
                Console.WriteLine("Search customer code")
                Else If Choice = 4 Then
                    End If
```
Examiner comment – middle

Candidates are asked to state the programming language used in the code which follows. In part (a)(i) the candidate should realise that all lines of the pseudocode will generate some action. There is no mention of the display of the list of actions coded as procedure DisplayMenu.

In part (a)(ii) the candidate has correctly identified that the code is designed to trap an invalid response from the user.

In part (b)(i) the candidate has correctly stated that the loop will iterate at most three times but is then unable to comment on the practical reason for this in part (b)(ii). Candidates should appreciate that the code has shown ‘good practice’ and used meaningful identifier names – so use of the identifier NoOfAttempts in the question rubric should provide a trigger.

For part (c) the candidate has not used the exact pseudocode syntax documented in the syllabus section 2.3.3 which has been condoned. Also note the omission of the speech mark delimiters from the case 3 text. Candidates need to pay attention to detail such as this.

For the program code in part (d) there are some correctly formed statements. The candidate needs to appreciate the overall structure of the requirement. The DisplayMenu procedure needs to be inside a loop which terminates when the user selects option 4 from the menu.

Marks awarded for part (a) = (i) 2/3, (ii) 1/1
Marks awarded for part (b) = (i) 1/1, (ii) 0/1
Marks awarded for part (c) = 3/3
Marks awarded for part (d) = 4/8

Total marks awarded = 11 out of 17
2. A program displays a menu with choices 1 to 4. The code to display the menu is written as the procedure DisplayMenu.

(a) Pseudocode which uses this procedure is:

```plaintext
CALL DisplayMenu
REPEAT
OUTPUT "Enter choice (1..4)"
INPUT Choice
UNTIL Choice >= 1 AND Choice <= 4
```

(i) Describe what this pseudocode will do.

The DisplayMenu program is called from within the main as it is executed. This program is in a loop as soon as the

```plaintext
if
```
then
is not chosen in parameters, it will loop in an ...[3]

```
```

(ii) State why a loop is required.

A loop is required because if an error is made,

```plaintext
if
```
```plaintext
then
```
```plaintext
without a loop, it would be very hard.
```

(b) The following pseudocode is a revised design.

```plaintext
CONSTANT i ← 3
CALL DisplayMenu
NoOfAttempts ← 0
REPEAT
OUTPUT "Enter choice (1..4)"
INPUT Choice
NoOfAttempts ← NoOfAttempts + 1
UNTIL (Choice >= 1 AND Choice <= 4) OR NoOfAttempts = i
```

(i) Give the maximum number of inputs the user could be prompted to make.

[3]

(ii) State why this algorithm is an improvement on the one given in part (a).

This is because the algorithm gives a person a considerable amount of choice, thus allowing them to enter their 1
be able to input correct data, otherwise some malicious activity might be going on.
Example candidate response – low, continued

(c) The pseudocode is in its initial stage of development.

The table below shows the action currently taken by the pseudocode following each menu choice.

<table>
<thead>
<tr>
<th>Menu choice</th>
<th>Description</th>
<th>Program response</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Read data from the customer file</td>
<td>Calls a procedure ReadFile which for testing purposes outputs the message “Read file code”</td>
</tr>
<tr>
<td>2</td>
<td>Add a customer</td>
<td>Outputs message “Add customer code”</td>
</tr>
<tr>
<td>3</td>
<td>Search for a customer</td>
<td>Outputs message “Search customer code”</td>
</tr>
<tr>
<td>4</td>
<td>Terminates the program</td>
<td>Ends</td>
</tr>
</tbody>
</table>

Complete the pseudocode for the design in part (b), shown again below, to respond to each menu choice.

```
CONSTANT i ← 3
CALL DisplayMenu
NoOfAttempts ← 0
REPEAT
    OUTPUT "Enter choice (1..4)"
    INPUT Choice
    NoOfAttempts ← NoOfAttempts + 1
    UNTIL (Choice >= 1 AND Choice <= 4) OR NoOfAttempts = i

    IF Choice = 1
    CALL ReadFile
    OUTPUT "Read File Code"
    ELSE
    IF Choice = 2
    OUTPUT "Add Customer Code"
    ELSE IF Choice = 3
    OUTPUT "Search Customer Code"
    ELSE
    END IF
    END IF
END
```
(d) The algorithm in part (c) is to be amended. The program will:

- repeatedly display the menu and respond to the user's choice
- terminate when the user enters 4

Write program code for this final design which will be made up of:

- the main program
- procedure `ReadFile`
- procedure `DisplayMenu`

Visual Basic and Pascal: You should include the declaration statements for variables.
Python: You should show a comment statement for each variable used with its data type.

Programming language: **Python**

```python
# Display Menu...is the main program...it contains a variable 'choice' which is integer.

i = 0  # Initialisation

for i = 3  # OR  choice != 1 AND choice <= 4
    print("Enter choice (1, 2, 3, 4):")

    choice = input(int(choice))

    if choice == 1:
        print("Add customer code")
    elif choice == 2:
        print("Remove customer code")
    elif choice == 3:
        print("Search, append, (customer code)")
    else:
        print("Exit")

    if choice != 1:
        call 'Read File'
        print("Read file code")
```

[Turn over]
Examiner comment – low

In part (a)(i) the candidate needs to realise that the use of the call statement is for a procedure. The candidate has incorrectly identified this as a ‘program’. The candidate has then correctly identified there will be a prompt for the user but there is no mention of this being followed by the input from the user. Part (a)(ii) needs to be clearly expressed. Clear expression of some process is a key skill for the computer scientist.

In part (b)(i) the candidate has correctly identified that there will be at most three iterations but this is followed in part (ii) with a statement that there will be a ‘considerable’ amount of tries allowed. The key point needs to be made that the code is designed to limit the number of attempts to a stated maximum.

In part (c) the candidate has followed the rubric to write pseudocode and this shows three correctly formed nested IF statements.

In part (d) the candidate has stated that the language to be used in Python. However, they have not followed the question rubric for a Python answer and shown a comment statement for each variable used with its data type. This answer has few aspects of the key design present. There has been no attempt to show separate procedures for the ReadFile and DisplayMenu code. Also the question rubric to repeatedly display the menu is not present.

Marks awarded for part (a) = (i) 1/3, (ii) 0/1
Marks awarded for part (b) = (i) 1/1, (ii) 0/1
Marks awarded for part (c) = 3/3
Marks awarded for part (d) = 2/8

Total marks awarded = 7 out of 17
Question 3

3 When the guarantee on a computer runs out, the owner can take out insurance to cover breakdown and repairs.

The price of the insurance is calculated from:

- the model of the computer
- the age of the computer
- the current insurance rates

Following an enquiry to the insurance company, the customer receives a quotation letter with the price of the insurance.

A program is to be produced.

The structure chart below shows the modular design for this process:

![Structure Chart](image-url)
Question 3, continued

(a) Using the letters A to D, add the labelling to the chart boxes on the opposite page.

<table>
<thead>
<tr>
<th>Modules</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Send quotation letter</td>
</tr>
<tr>
<td>B</td>
<td>Calculate price</td>

Example candidate response – high

3. When the guarantee on a computer runs out, the owner can take out insurance to cover breakdown and repairs.

The price of the insurance is calculated from:

- the model of the computer
- the age of the computer
- the current insurance rates

Following an enquiry to the insurance company, the customer receives a quotation letter with the price of the insurance.

A program is to be produced.

The structure chart below shows the modular design for this process:

![Structure Chart Image]

Examiner comment – high

This is a strong answer. The labelling of the top control box and the procedures is correct. The candidate has correctly identified the data items recorded from the input stage and then correctly used the model and age of the computer for the calculation of the premium price. However, it will be the policy charge which is the output item from procedure B. The items needed for procedure A (send the quotation letter) have been correctly identified.

Marks awarded for part (a) = 2/2
Marks awarded for part (b) = 3/4

Total marks awarded = 5 out of 6
3 When the guarantee on a computer runs out, the owner can take out insurance to cover breakdown and repairs.

Following an enquiry to the insurance company, the customer receives a quotation letter with the price of the insurance.

A program is to be produced.

The structure chart below shows the modular design for this process:

---

Examiner comment – middle

The candidate has not followed the rubric of the question and used the letters to complete the labelled of the structure chart. The question has been designed in this way to reduce the amount the candidate has to write.

The candidate has interpreted the text ‘send quotation letter’; as a letter which is sent out to the computer owner as an invite to produce a quotation. The candidate should realise that this is a letter which is sent out at the end of the process – to notify the policyholder of the amount the insurance will cost.

The candidate has however ‘recovered’ with the correct labelling of all the data item arrows for the answer to part (b) and was not penalised for the failure to use letters for the labelling.

Marks awarded for part (a) = 0/2
Marks awarded for part (b) = 4/4

Total marks awarded = 4 out of 6
Example candidate response – low

3 When the guarantee on a computer runs out, the owner can take out insurance to cover breakdown and repairs.

- the age of the computer
- the current insurance rates

Following an enquiry to the insurance company, the customer receives a quotation letter with the price of the insurance.

A program is to be produced.

The structure chart below shows the modular design for this process:

Examiner comment – low

Candidates need to make the link in the syllabus content between the drawing of a structure chart (section 2.1.2) and the use of procedures when writing program code (Section 2.3.6). Passing parameter values into and out of a procedure call is exactly what the arrows on this structure chart are depicting.

The candidate should appreciate that the control box will describe some overarching process – in this case ‘produce insurance quotation’. It then follows that the three processes – in this case the sequence D, B and A – make up this process. The candidate has correctly identified A as the final procedure in the sequence but both D and A were required to secure a mark.

Marks awarded for part (a) = 0/2
Marks awarded for part (b) = 2/4

Total marks awarded = 2 out of 6
Question 4

A game is played between two players:

- they take turns at rolling a six-sided die (numbered 1 to 6) and record their throw
- a player scores 1 point if their throw is higher than their opponent
- they each roll the die 20 times
- if the player's throw is the same as their opponent, the total points is unchanged
- the winner is the player with the larger number of points after 20 throws

The pseudocode will use variable NoOfThrows as shown.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NoOfThrows</td>
<td>INTEGER</td>
<td>Loop control variable</td>
</tr>
</tbody>

```
FOR NoOfThrows ← 1 to 20

INPUT Player1Throw
    IF Player1Throw > Player2Throw
        Player1Total ← Player1Total + 1
        Player1Throw ← Player1Throw + 1
    ENDIF
    IF Player2Throw > Player1Throw
        Player2Total ← Player2Total + 1
    ENDIF
ENDFOR

IF Player1Total > Player2Total
    OUTPUT "Player1 is the winner"
ELSE
    OUTPUT "Player2 is the winner"
ENDIF
```

(ii) Identify the game result which will produce incorrect output.

- If both have entered the same input.
- If `Player1Throw = Player2Throw`
Examiner comment – high

This is a perfect answer for the pseudocode in part (i). Candidates should note that ENDFOR is one word in the syllabus pseudocode.

Part (ii) – like the earlier question 2(a)(i) and 2(b)(ii) – required a clear descriptive statement. Here the candidate needed to make clear it is the final score of each player that determines a draw result. The candidate should not have confused ‘throws’ with the final total.

Marks awarded for part (i) = 5/5
Marks awarded for part (ii) = 0/1

Total marks awarded = 5 out of 6
Example candidate response – middle

4 A game is played between two players:
   • they take turns at rolling a six-sided die (numbered 1 to 6) and record their throw
   • a player scores 1 point if their throw is higher than their opponent
   • they each roll the die 20 times
   • if the player’s throw is the same as their opponent, the total points is unchanged
   • the winner is the player with the larger number of points after 20 throws

(a) Name the data structure to be used in a program for SalesX.

..............................................................................................................................................[2]
Question 5 – parts (a), (b) and (c), continued

(b) The programmer writes a program from the following pseudocode design.

\[
x \leftarrow 0
\]
\[
\text{FOR DayNumber } \leftarrow 1 \text{ TO 7}
\]
\[
\quad \text{IF SalesX[DayNumber]} + \text{SalesY[DayNumber]} \geq 10
\]
\[
\quad \text{THEN}
\]
\[
\quad \quad x \leftarrow x + 1
\]
\[
\quad \quad \text{OUTPUT SalesDate[DayNumber]}
\]
\[
\quad \text{ENDIF}
\]
\[
\text{ENDFOR}
\]
\[
\text{OUTPUT x}
\]

(i) Trace the execution of this pseudocode by completing the trace table below.

<table>
<thead>
<tr>
<th>x</th>
<th>DayNumber</th>
<th>OUTPUT</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>

(ii) Describe, in detail, what this algorithm does.

..................................................................................................................................................

..................................................................................................................................................

..................................................................................................................................................

..................................................................................................................................................[3]
Question 5 – parts (a), (b) and (c), continued

(c) The company wants a program to output the total monthly sales for one of the selected websites.

The programmer codes a function with the following function header:

FUNCTION MonthlyWebsiteSales(ThisMonth : INTEGER, ThisSite : CHAR) 
   RETURNS INTEGER

The function returns the total number of bicycles sold for the given month and website.

The function will use the following:

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ThisMonth</td>
<td>INTEGER</td>
<td>Represents the month number e.g. 4 represents April</td>
</tr>
<tr>
<td>ThisSite</td>
<td>CHAR</td>
<td>Coded as:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• X for website X</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Y for Website Y</td>
</tr>
</tbody>
</table>

(i) Give the number of parameters of this function. ........................................................................[1]

(ii) Some of the following function calls may be invalid.

Mark each call with:
• a tick (√), for a valid call
• a cross (ₓ), for an invalid call

For any function calls which are invalid, explain why.

<table>
<thead>
<tr>
<th>Function call</th>
<th>Tick (√) / cross (ₓ)</th>
<th>Explanation (if invalid)</th>
</tr>
</thead>
<tbody>
<tr>
<td>MonthlyWebsiteSales(1, &quot;Y&quot;)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>MonthlyWebsiteSales(11, 'X', 'Y')</td>
<td></td>
<td></td>

</tr>
<tr>
<td>2</td>
<td>5</td>
<td>07/06/2015</td>
</tr>
<tr>
<td>2</td>
<td>6</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>7</td>
<td>08/06/2015 , 3</td>
</tr>
</tbody>
</table>

(ii) Describe, in detail, what this algorithm does.

This algorithm outputs the number of days in a week in which the sales of X and Y were greater than or equal to 10. It also outputs the specific dates on which the sales of X and Y were greater than or equal to ten.
Example candidate response – high, continued

(c) The company wants a program to output the total monthly sales for one of the selected websites.

The programmer codes a function with the following function header:

```plaintext
FUNCTION MonthlyWebsiteSales(ThisMonth : INTEGER, ThisSite : CHAR) 
  RETURNS INTEGER
```

The function returns the total number of bicycles sold for the given month and website.

The function will use the following:

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ThisMonth</td>
<td>INTEGER</td>
<td>Represents the month number e.g. 4 represents April</td>
</tr>
</tbody>
</table>
| ThisSite    | CHAR      | Coded as:
  • X for website X
  • Y for Website Y |

(i) Give the number of parameters of this function. ..........................2..........................[1]

(ii) Some of the following function calls may be invalid.

Mark each call with:
• a tick (✓), for a valid call
• a cross (✗), for an invalid call

For any function calls which are invalid, explain why.

<table>
<thead>
<tr>
<th>Function call</th>
<th>Tick (✓) /cross (✗)</th>
<th>Explanation (if invalid)</th>

<tr>
<td>MonthlyWebsiteSales(12, 'X')</td>
<td>✗</td>
<td>' ' are used instead of &quot;&quot;</td>
</tr>
</tbody>
</table>

[5]
Examiner comment – high

Candidates need to be aware that there are two types of array in the Section 2 syllabus – a one-dimensional and two-dimensional array. Also, an array will be declared with a lower and upper bound and be of a stated data type. The syntax to use for the pseudocode is given in syllabus section 2.2.2. A formal description was not required for this question – just a statement that a 1D array with data type integer would be the most appropriate data structure to use. There were many candidate answers which simply stated ‘array’ and did not gain credit.

For part (b) the trace shown was an exemplary answer and the candidate carries this through into part (ii) with a clear description of the algorithm.

For part (c) candidates need to realise that it is convention for paper 2 (and Paper 4) that string data will use double quote delimiters and a character value will have single quote delimiters around the single character. Candidates were however given the benefit of the doubt – as shown with this answer – and a statement that this first call was correctly formed was given credit. The explanation for the second call is exemplary with a clear reference to the need for two parameters. The candidate’s misunderstanding about the use of single and double quotes is confirmed by their answer for the third procedure call.

Marks awarded for part (a) = 0/2
Marks awarded for part (b) = (i) 4/4, (ii) 3/3
Marks awarded for part (c) = (i) 1/1, (ii) 2/3

Total marks awarded = 10 out of 13

</thead>
<tbody>
<tr>
<td>MonthlyWebsiteSales(1, &quot;Y&quot;)</td>
<td>√</td>
<td></td>
</tr>
<tr>
<td>MonthlyWebsiteSales(11, 'X', 'Y')</td>
<td>×</td>
<td>Can only call from one site</td>
</tr>
<tr>
<td>MonthlyWebsiteSales(12, 'X')</td>
<td>√</td>
<td></td>
</tr>
</tbody>
</table>

[3]
Examiner comment – middle

See comments for the high script for part (a).

For part (b) the trace is almost complete – only the output of the total has been omitted. For part (ii) the key word in the question is to ‘describe’. What is required therefore is not a simple repeat of the wording of the statement in the algorithm. The total numbers of sales from Site X and Site Y is a clear description, the answer given here is a just a pseudocode statement re-word.

For part (c)(ii) the middle row does not gain credit as the candidate is expected to make reference to the number of parameters used.

For part (d) candidates need to have studied the pseudocode syntax given in the syllabus for file handling – Section 2.2.3. Candidates should appreciate that the file is opened for one of three possible ‘modes’. That is, to write data to the file, read data from an existing file or to append new data to an existing file. Once the pseudocode has been introduced, teachers should encourage students to put this into practice in their chosen programming language.

Marks awarded for part (a) = 0/2
Marks awarded for part (b) = (i) 3/4, (ii) 1/3
Marks awarded for part (c) = (i) 0/1, (ii) 2/3

Total marks awarded = 6 out of 13

<tr>
<td>6</td>
<td>7</td>
<td></td>
</tr>
</tbody>
</table>

(ii) Describe, in detail, what this algorithm does.

If the total sales from SalesX and SalesY is equal or bigger than 10, it is added to the counter 'x'.
Suppose counter 'x' can be some thing similar to a break even point of the business.
(c) The company wants a program to output the total monthly sales for one of the selected websites.

The programmer codes a function with the following function header:

FUNCTION MonthlyWebsiteSales(ThisMonth : INTEGER, ThisSite : CHAR) 
RETURNS INTEGER

The function returns the total number of bicycles sold for the given month and website.

The function will use the following:

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ThisMonth</td>
<td>INTEGER</td>
<td>Represents the month number e.g. 4 represents April</td>
</tr>
</tbody>
</table>
| ThisSite   | CHAR      | Coded as:  
• X for website X  
• Y for Website Y |

(i) Give the number of parameters of this function. ........................................... [1]

(ii) Some of the following function calls may be invalid.

Mark each call with:
• a tick (√), for a valid call
• a cross (×), for an invalid call

For any function calls which are invalid, explain why.

<table>
<thead>
<tr>
<th>Function call</th>
<th>Tick (√) / cross (×)</th>
<th>Explanation (if invalid)</th>
</tr>
</thead>
<tbody>
<tr>
<td>MonthlyWebsiteSales(1, &quot;Y&quot;)</td>
<td>√</td>
<td></td>
</tr>
<tr>
<td>MonthlyWebsiteSales(11, 'X', 'Y')</td>
<td>√</td>
<td></td>
</tr>
<tr>
<td>MonthlyWebsiteSales(12, 'X')</td>
<td>×</td>
<td></td>
</tr>
</tbody>
</table>
Examiner comment – low

This is a weak answer for all three parts.

For part (a) see the comments for the high script about the use and description of arrays.

In part (b) the candidate has correctly iterated through the FOR loop to show the DayNumber values, but the corresponding x values in column 1 are incorrect.

In part (b)(ii) the key points to describe the algorithm have not been mentioned.

For part (c)(ii) see the comment made for the Grade A script concerning the use of double and single quote delimiters.

Marks awarded for part (a) = 0/2
Marks awarded for part (b) = (i) 1/4, (ii) 1/3
Marks awarded for part (c) = (i) 0/1, (ii) 2/3

Total marks awarded = 4 out of 13
Question 5 – parts (d) and (e)

(d) The company decides to offer a discount on selected dates. A program is written to indicate the dates on which a discount is offered.

The program creates a text file, DISCOUNT_DATES (with data as shown), for a number of consecutive dates.

<table>
<thead>
<tr>
<th>Date</th>
<th>Discount</th>
</tr>
</thead>
<tbody>
<tr>
<td>03/06/2015</td>
<td>TRUE</td>
</tr>
<tr>
<td>04/06/2015</td>
<td>FALSE</td>
</tr>
<tr>
<td>05/06/2015</td>
<td>FALSE</td>
</tr>
<tr>
<td>06/06/2015</td>
<td>FALSE</td>
</tr>
<tr>
<td>07/06/2015</td>
<td>FALSE</td>
</tr>
<tr>
<td>08/06/2015</td>
<td>FALSE</td>
</tr>
<tr>
<td>09/06/2015</td>
<td>FALSE</td>
</tr>
<tr>
<td>10/06/2015</td>
<td>TRUE</td>
</tr>
<tr>
<td>11/06/2015</td>
<td>FALSE</td>
</tr>
<tr>
<td>01/07/2015</td>
<td>FALSE</td>
</tr>
</tbody>
</table>

Each date and discount indicator is separated by a single <Space> character.

The discount indicators are:

- FALSE – indicates a date on which no discount is offered
- TRUE – indicates a date on which a discount is offered

A programming language has the built-in function CONCAT defined as follows:

```plaintext
CONCAT(String1 : STRING, String2 : STRING [, String3 : STRING] )
```

RETURNS STRING

For example:

CONCAT("San", "Francisco") returns "SanFrancisco"
CONCAT("New", "York", "City") returns "NewYorkCity"

The use of the square brackets indicates that the parameter is optional.
Question 5 – parts (d) and (e), continued

The following incomplete pseudocode creates the text file DISCOUNT_DATES.

Complete the pseudocode.

OPENFILE "DISCOUNT_DATES" FOR ..............................................................................

INPUT .........................................................................................................................

WHILE NextDate <>"XXX"

    INPUT Discount

    ........................................ = CONCAT(NextDate, " ", Discount)

    WRITEFILE "DISCOUNT_DATES", NextLine

    INPUT NextDate

...........................................................................................................................

OUTPUT "File now created"

CLOSEFILE  [4]

(e) The DISCOUNT_DATES text file is successfully created.

The company now wants a program to:
• key in a date entered by the user
• search the text file for this date
• if found, output one of the following messages:
   • "No discount on this date"
   • "This is a discount date"
• if not found, output “Date not found”

(i) Add to the identifier table to show the variables you need for this new program.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISCOUNT_DATES</td>
<td>FILE</td>
<td>Text file to be used</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

[3]
(ii) Write the program code.

*Do not include any declaration or comment statements for the variables used.*

Programming language

[7]
Mark scheme

(d) OPENFILE "DISCOUNT_DATES" FOR WRITE / WRITING (1)
INPUT NextDate (1)
WHILE NextDate <> "XXX"
   INPUT Discount
   NextLine = CONCAT(NextDate, " ", Discount) (1)
   WRITEFILE "DISCOUNT_DATES" , NextLine
ENDWHILE (1)
OUTPUT "File now created"
CLOSEFILE

(e) (i) Sensible Identifier + Data Type + Description (1 + 1 + 1)

For example:
ThisDate STRING/DATETIME date 'entered by user'
Found BOOLEAN flag to indicate ThisDate is 'present in the file'
NextLine STRING a single line 'from the text file'
NextDate STRING/DATETIME date 'from next line in the file'
NextDiscount STRING the discount value from NextLine
ThisMonth INTEGER the month part of the date (input or from file)
MyStreamReader STREAMREADER references DISCOUNT_DATES file

Reject 'generic' reserved words
Allow one instance variable to store output string(s)
Allow one instance of month/day/year number e.g. ThisMonth shown above [3]

(ii) Mark as follows:

Open file statement (1)
File read statement for line text – NextLine (1)
File close statement (1)

Input of the required date – ThisDate (1)

Isolate NextDate from NextLine (1)
Isolate NextDiscount from NextLine (1)

IF statement comparing the two dates (1)
Uses Boolean variable Found to flag when found (1)

Post/pre condition loop iterate through the file (1)
Test for EOF or 'found' (1)

Note: These must follow some correct logic to score ...
Output 'No discount on this date' and Output 'This is a discount date') (1)
Output (when date not found) 'Date not found' (1)

Accept 'any' identifier names [max 7]
The following incomplete pseudocode creates the text file DISCOUNT_DATES.

Complete the pseudocode.

```
OPENFILE "DISCOUNT_DATES" FOR WRITE

INPUT NextDate

WHILE NextDate <> "XXX"
    INPUT Discount
    DiscountDate = CONCAT(NextDate, " ", Discount)
    WRITEFILE "DISCOUNT_DATES", NextLine
    INPUT NextDate
END WHILE

OUTPUT "File now created"
CLOSEFILE
```

(e) The DISCOUNT_DATES text file is successfully created.

The company now wants a program to:
- key in a date entered by the user
- search the text file for this date
- if found, output one of the following messages:
  - "No discount on this date"
  - "This is a discount date"
- if not found, output "Date not found"

(i) Add to the identifier table to show the variables you need for this new program.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Data type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISCOUNT_DATES</td>
<td>FILE</td>
<td>Text file to be used</td>
</tr>
<tr>
<td>SrDiscountDate</td>
<td>FILE</td>
<td>Open file in reading mode</td>
</tr>
<tr>
<td>Date</td>
<td>String</td>
<td>Date entered by user</td>
</tr>
<tr>
<td>Found</td>
<td>Boolean</td>
<td>To know if date is found in file or not</td>
</tr>
<tr>
<td>date_discount</td>
<td>String</td>
<td>One line read from file</td>
</tr>
<tr>
<td>Length</td>
<td>Integer</td>
<td>Length of string date_discount</td>
</tr>
<tr>
<td>Discount</td>
<td>String</td>
<td>Discount's state from &quot;date_discount&quot;</td>
</tr>
<tr>
<td>Date_saved</td>
<td>Integer</td>
<td>Date from &quot;date_discount&quot;</td>
</tr>
</tbody>
</table>

[4]
Example candidate response – high, continued

(ii) Write the program code.

Do not include any declaration or comment statements for the variables used.

Programming language: Visual Basic

srDiscountDates. To File. OpenText ("DiscountDates.txt")
Console.WriteLine ("Enter Date")

Date = Console.ReadLine

While NOT srDiscountDates.File.Peek(4)
    Found = False
    Do While NOT srDiscountDates.File.Peek(4) AND
        Found = FALSE
    DateDiscount = Console.ReadLine
    Length = Len (DateDiscount)
    Discount = Right (DateDiscount, Length - 6)
    DateSaved = Left (DateDiscount, 6)
    If DateSaved = date THEN
        Found = True
    EndIf
    EndWhile
    If Found = True THEN
        If Discount = "True"
            Console.WriteLine ("This is a discount date")
        Else
            Console.WriteLine ("No discount on this date")
        EndIf
    Else
        Console.WriteLine ("Date not found")
    EndIf

Part (d) is a sound answer with the candidate understanding the use of a file for reading data from it. The candidate has ‘made up’ their own identifier name on line 5. This was not necessary as it can be deduced from the statement given on the next line. This is a good example where the best prepared candidates will have been those who had been exposed by their teacher to the pre-release materials with the `CONCAT` function being covered.

The intention for the final part (e) was to get the candidate to consider – before attempting to write any code – what variables would be needed for the task. This is a sound answer with the candidate using (mostly) appropriate identifier names, the correct data type and a clear description. `Date` as an identifier name was not considered appropriate.

This is an excellent answer for the program code. All aspects of the task have been correctly designed and coded. The candidate clearly has ‘looked back’ to the answers they gave for part (i) and used the same identifiers in the code for part (ii).

Marks awarded for part (d) = 3/4
Marks awarded for part (e) = (i) 3/3, (ii) 7/7

Total marks awarded = 13 out of 14
The following incomplete pseudocode creates the text file \texttt{DISCOUNT\_DATES}.

Complete the pseudocode.

\begin{verbatim}
OPENFILE "DISCOUNT\_DATES" FOR READ
INPUT NextDate
WHILE NextDate <> "XXX"
    INPUT discount
    ........................................ = CONCAT(NextDate, " ", Discount)
    WRITEFILE "DISCOUNT\_DATES", NextLine
    INPUT NextDate
ENDWHILE
END

OUTPUT "File now created"
CLOSEFILE
\end{verbatim}

(e) The \texttt{DISCOUNT\_DATES} text file is successfully created.

The company now wants a program to:

- key in a date entered by the user
- search the text file for this date
- if found, output one of the following messages:
  - "No discount on this date"
  - "This is a discount date"
- if not found, output "Date not found"

(i) Add to the identifier table to show the variables you need for this new program.

\begin{table}
\begin{tabular}{|l|l|l|}
\hline
\textbf{Identifier} & \textbf{Data type} & \textbf{Description} \\
\hline
\texttt{DISCOUNT\_DATES} & \texttt{FILE} & Text file to be used \\
\texttt{Date\_KEY\_DATE} & \texttt{URL} & \\
\texttt{DAY} & \texttt{INTEGER} & Day part of date entered by user \\
\texttt{MONTH} & \texttt{INTEGER} & Month part of date entered by user \\
\texttt{YEAR} & \texttt{INTEGER} & Year part of date entered by user \\
\texttt{FOUND} & \texttt{BOOLEAN} & Flag true if data match and false otherwise \\
\texttt{2\_DAY} & \texttt{INTEGER} & Day part of date searched in file \\
\texttt{2\_MONTH} & \texttt{INTEGER} & Month part of date searched in file \\
\texttt{2\_YEAR} & \texttt{INTEGER} & Year part of date searched in file \\
\hline
\end{tabular}
\end{table}
Examiner comment – middle

The script has secured half the marks for the file handling pseudocode. Candidates need to be clear about the difference between opening a file in ‘read’ or ‘write’ mode.

Part (e)(i) shows a good attempt at identifying the data requirements for the task. Year was a questionable choice for an identifier name but has been given credit.

The candidate has demonstrated some sound understanding of some of the key statements in Visual Basic – for example, creating a ‘streamreader’ object and the input from the user of the required date. However this needs to be complemented with the design of the algorithm for the given task.

Marks awarded for part (d) = 2/4
Marks awarded for part (e) = (i) 2/3, (ii) 3/7

Total marks awarded = 7 out of 14

The attempt at part (d) shows no awareness of the pseudocode shown in the syllabus for file handling – section 2.2.3.

In part (e)(i) a good attempt has been made at identifying the data requirements for the task. As the questions shows a total of three marks, the candidate should have anticipated that at least three variables would need to be shown for maximum marks.

In part (e)(ii) there is some good evidence of knowledge of the syntax of certain Pascal statements and these have been credited. However, the candidate needs to appreciate that some of the marks will be awarded for demonstrating a design that works for the given task.

Marks awarded for part (d) = 0/4
Marks awarded for part (e) = (i) 2/3, (ii) 2/7

Total marks awarded = 4 out of 14
