</table>

(i) Define the following terms.

enthalpy change of solution .........................................................................................................................

..................................................................................................................................................................

enthalpy change of hydration ........................................................................................................................

..................................................................................................................................................................

[2]

(ii) Calculate the standard enthalpy change of hydration of the chloride ion, Cl\(^{-}\) (g). It may be helpful to draw an energy cycle. Show all your working.

\[ \Delta H_{\text{hyd}}^\circ (\text{Cl}^- (g)) = \ldots \ldots \ldots \ldots \ldots \text{kJ mol}^{-1} \] [2]
(e) Calcium fluoride, $\text{CaF}_2(\text{s})$, can be synthesised directly from its elements.

The value of $\Delta H^\circ_\text{f}(\text{CaF}_2(\text{s}))$ is $-1214 \text{ kJ mol}^{-1}$.

(i) Predict the sign of the entropy change, $\Delta S^\circ$, for this synthesis. Explain your answer.

The sign of the entropy change is .................................

explanation ..........................................................................................................................................
..........................................................................................................................................................
..........................................................................................................................................................
......................................................................................................................................................... [1]

(ii) Use the value of $\Delta H^\circ_\text{f}(\text{CaF}_2(\text{s}))$ given in (e) and your answer to (e)(i) to predict how the feasibility for this synthesis will change with increasing temperature.

[Total: 11]
2 (a) Nitrogen monoxide, NO, reacts with ozone, O₃.

\[ \text{NO}(g) + \text{O}_3(g) \rightarrow \text{NO}_2(g) + \text{O}_2(g) \]

This reaction is first order with respect to both NO and O₃. At 298K, the rate constant \( k = 11500 \text{ mol}^{-1}\text{dm}^3\text{s}^{-1} \).

(i) Complete the rate equation for this reaction.

\[
\text{rate} = \boxed{} \]

(ii) A reaction is carried out in which the initial concentrations of NO and O₃ are both \( 1.20 \times 10^{-6} \text{ mol dm}^{-3} \).

Calculate the initial rate of the reaction. State its units.

rate of reaction = \boxed{} \text{ units} = \boxed{} \]

(iii) The reaction described in (a)(ii) is monitored over a period of time.

Predict whether or not the graph of [NO] against time, under these conditions, shows that the reaction has a constant half-life. Explain your answer.

prediction \boxed{}

explanation \boxed{}

(b) Nitrous oxide, N₂O, decomposes into its elements.

\[ 2\text{N}_2\text{O}(g) \rightarrow 2\text{N}_2(g) + \text{O}_2(g) \]

At a high temperature, a small amount of platinum wire is added to a large amount of nitrous oxide. The reaction follows zero order kinetics. The platinum wire behaves as a catalyst.

(i) Sketch a graph, on the axes below, of reaction rate against time for the catalysed decomposition of N₂O under these conditions.
(ii) Sketch a graph, on the axes below, of \([\text{N}_2\text{O}]\) against time for this reaction.

\[ \text{[N}_2\text{O]} \]

\[ \text{time} \]

(iii) Platinum behaves as a heterogeneous catalyst in this reaction.

Describe the mode of action of a heterogeneous catalyst.

..............................................................................................................................................
..............................................................................................................................................
..............................................................................................................................................
............................................................................................................................................... [3]

(iv) Suggest a reason why this reaction has zero order kinetics when the amount of nitrous oxide is large and the amount of platinum is small.

..............................................................................................................................................
............................................................................................................................................... [1]

.......................................................................................................................................................................................... [1]

(b) A molten magnesium salt is electrolysed for 15.0 minutes by a constant current.

$4.75 \times 10^{22}$ magnesium atoms are produced at the cathode.

Calculate the value of the current used.

\[ \text{current} = \text{......................... A} \] [2]

[Total: 11]
4 (a) The value of the solubility product, $K_{sp}$, of iron(III) hydroxide, Fe(OH)$_3$, is given by the following expression.

$$K_{sp} = [Fe^{3+}][OH^{-}]^3 = 2.0 \times 10^{-39} \text{ mol}^4 \text{ dm}^{-12}$$

(i) Calculate the solubility of Fe(OH)$_3$ in water.

solubility = ......................... mol dm$^{-3}$ [1]

(ii) Calculate the solubility of Fe(OH)$_3$ in 0.010 mol dm$^{-3}$ barium hydroxide, Ba(OH)$_2$(aq).

solubility = ......................... mol dm$^{-3}$ [2]

(iii) Fe(OH)$_3$ is less soluble in Ba(OH)$_2$(aq) than it is in pure water.

Name this effect.

.......................................................................................................................................................................................... [1]

(b) The numerical value of the $K_a$ of HBrO is $2.00 \times 10^{-9}$.

$X$ is a solution of HBrO which contains $4.00 \times 10^{-3}$ mol of HBrO in 100 cm$^3$ of solution. In this solution the following equilibrium is established in which there are two conjugate acid-base pairs.

$$\text{HBrO} + \text{H}_2\text{O} \rightleftharpoons \text{BrO}^- + \text{H}_3\text{O}^+$$

(i) Define conjugate acid-base pair.

.......................................................................................................................................................................................... [1]

(ii) Identify the two conjugate acid-base pairs shown in the equation above.

pair one  .........................  .........................
acid  base

pair two  .........................  .........................
acid  base

[1]
(iii) Calculate the pH of solution $X$. Show all your working.

\[ \text{pH} = \ldots \ldots \ldots \ldots \ldots \ldots \ldots [2] \]

(iv) A solution containing $2.00 \times 10^{-3}$ mol of NaOH is added to solution $X$. A buffer solution is formed.

Calculate the pH of this buffer solution.

\[ \text{pH} = \ldots \ldots \ldots \ldots \ldots \ldots \ldots [1] \]

[Total: 9]
Copper is a transition element. It forms a wide variety of compounds.

(a) Define transition element.

</tbody>
</table>

[3]

(ii) In an isolated Cu²⁺ ion the d-orbitals are all degenerate. In a complex ion such as [Cu(H₂O)₆]²⁺ the d-orbitals are non-degenerate.

Define degenerate and non-degenerate in this context.

degenerate ............................................................................................................................................
non-degenerate .................................................................................................................................. [1]

(iii) Explain why the solutions of the two complex ions in Table 5.1 are different colours.

.......................................................................................................................................................
.......................................................................................................................................................
.................................................................................................................................................... [1]

(c) Cu²⁺ forms a complex ion containing water molecules and ethanedioate ions, C₂O₄²⁻, as ligands. The formula of the complex is [Cu(C₂O₄)₂(H₂O)₂]³⁻. The ethanedioate ion is a bidentate ligand.

(i) Explain what is meant by bidentate.

.......................................................................................................................................................
.......................................................................................................................................................
.................................................................................................................................................... [1]
There are three stereoisomers with the formula \([\text{Cu(C}_2\text{O}_4)_2(\text{H}_2\text{O})_2]^{2-}\).

Complete the three-dimensional diagrams to show these three stereoisomers.

Stereoisomer 1

\[
\begin{array}{c}
\text{Cu} \\
\end{array}
\]

Stereoisomer 2

\[
\begin{array}{c}
\text{Cu} \\
\end{array}
\]

Stereoisomer 3

\[
\begin{array}{c}
\text{Cu} \\
\end{array}
\]

Use your answer to (c)(ii) to answer this question.

Stereoisomers 1, 2 and 3 show two different types of isomerism.

Name these two types of isomerism.

For each type of isomerism identify the pair of stereoisomers that demonstrate this isomerism.

<table>
<thead>
<tr>
<th>type of isomerism</th>
<th>pair of stereoisomers</th>

(d) A mixture of tyrosine and lysine can be separated by thin-layer chromatography. Under certain conditions the \(R_f\) value of lysine is 0.14 and the \(R_f\) value of tyrosine is 0.45.

(i) Explain what is meant by \(R_f\) value.

...............................................................................................................................................

.............................................................................................................................................  [1]

(ii) Suggest an explanation for the difference in \(R_f\) values.

...............................................................................................................................................

.............................................................................................................................................  [1]

[Total: 10]
### Important values, constants and standards

<table>
